EC NUTRITION	1.6	1.6	1.8	1.8	1.8	1.8	1.8	2.3	1.6	1.6	0.0

This cultivation schedule is intended for plants that develop flowers or fruits, starting from a one-week-old cutting or seedling. The duration of each phase depends on crop species, cultivar, desired plant size and/or plants per m².

To set your plants up very early on as a cutting or seedling, check out CANNA Start. This is to be used prior to commencing the grow guide above.

For a longer flowering phase, repeat the recommended dosages from Generative Phase I (W3-W5). Add CANNA PK 13/14 in the period 3-4 weeks before harvest.

Recommended pH is between 5.5 and 6.2.

Rooting: Start/rooting; make substrate wet.

Vegetative phase I: Plants develop in volume.

Vegetative phase II: Up to growth stagnation after fructification or appearance of the formation of flowers.

Generative phase I: Flowers or fruits develop in length. Growth in height achieved.

Generative phase II: Development of the volume (breadth) of flowers or fruit.

Generative phase III: Development of the mass (weight) of flowers or fruit.

Generative phase IV: Flowers or fruit ripening process.

Note: All recommended dosages are derived from our standardized powder nutrient stock.

SOLUTIONS

SOLID FERTILIZER FOR COCO SUBSTRATES,
OFFERING MAXIMUM CONTROL AND EFFICIENCY.

SOLID FERTILIZER FOR MAXIMUM CONTROL AND EFFICIENCY

CANNA Coco Dry A and B are **high quality dry fertilizers** that fully dissolve in water and provide a complete nutrient profile **for coco cultivation**. The formula is developed as a dry variant of the trusted CANNA Coco line and offers the same proven results in a compact and stable powder form that is easy to transport and store.

DEVELOPED FOR THE UNIQUE PROPERTIES OF COCO

Coco substrate is known for its ability to bind certain ions while releasing others. Coco Dry is **specifically formulated** to work in harmony with this behavior. As a result the product works together with the substrate and the plant receives a complete and balanced supply of nutrients. This clearly sets CANNA Coco Dry apart from alternatives that are adapted from standard fertilizers.

HIGHLY CONCENTRATED AND FREE OF FILLERS

CANNA Coco Dry contains only high quality nutrient salts **with no unnecessary fillers**. This makes the product economical light to transport and stable during storage. Thanks to the pure composition less material is required to reach the same EC level. Practical tests showed that significantly **less product is needed** to reach the desired EC level than you may be accustomed to.

RELIABLE RESULTS AT LOW EC

Because the nutrient balance closely matches **the needs of the plant** the amount of excess elements in drain water remains very limited. This allows cultivation at **a lower EC** around two point zero mS per cm. This makes the process less sensitive to changing climate conditions than systems that run at higher EC values.

STABLE, SOLUBLE AND EASY TO USE

These dry fertilizers are **exceptionally stable** and remain free-flowing, even under less-than-ideal storage conditions. Thanks to the uniform particle size of both components, they are **easy to scoop and dose accurately**. They fully dissolve in water and are suitable for both RO water and tap water with an EC up to 0.6 mS per cm. This ensures reliability and ease of use in daily practice. Their stability also **reduces residue buildup and clumping**, lowering the risk of clogged pipes and minimizing the need for frequent flushing.

CHOOSING BETWEEN LIQUID AND SOLUBLE FERTILIZERS

Now offering both our renowned **liquid fertilizers** and a new **soluble Coco fertilizer**. There's no one-size-fits-all solution; the best choice depends on your unique facility and growing goals. Whether you prioritize ease of use, precision, or scalability, our expert advisors are here to help you select the perfect fit for your operation.

SOLUTIONS

CANNA
The solution for growth and bloom

KEY BENEFITS

Experience high-efficiency nutrition designed for coco substrates. Our dry fertilizers dissolve completely, deliver strong results at low EC values and reduce both product use and system maintenance.

- + **Completely dissolving dry formula**
- + **Highly concentrated, premium ingredients**
- + **Tailored for coco buffering**
- + **Up to 45% product savings**
- + **Low EC performance (~2.0 mS/cm)**
- + **Injection-system compatible**
- + **Storage-stable and precise to dose**
- + **Low residue, low maintenance**
- + **Perfectly compatible with CANNA Coco substrates**

INSTRUCTIONS & GUIDELINES

Prepare 2 separate concentrate tanks properly every time. Always use a 2:1 (A:B) ratio. **Do not mix A and B in the same tank.** Prepare each concentrate separately, then dose them together through your system. Do not combine concentrated solutions.

- Wear suitable protection while handling and mixing.
- Store concentrates sealed at a stable temperature.
- Use prepared nutrient solution within seven days.
- For best results combine with CANNA BOOST, CANNA RHIZOTONIC, CANNAZYM and CANNA PK 13/14.

LITERS MIXING RATIO (per tank)

Tank	Coco Dry A	RO water
A	20 kg (2 bags)	100 liters
Tank	Coco Dry B	RO water
B	10 kg (1 bag)	100 liters
